| 説明   |    |       |            |
| <p>The number of allowable conditions for a single target is not specified. This implies that any number is allowed. There are cases where multiple conditions work, for example a component that should start once both a time has passed and another component has started. However, there are times when this will cause conflicts, such as differing sequence numbers or waiting for two timeouts.</p> |    |       |            |
